

# Package ‘CPAT’

September 24, 2018

**Title** Change Point Analysis Tests

**Version** 0.0.0.9000

**Description** Implements several statistical tests for structural change in R.

**Depends** R (>= 3.2)

**Suggests** cointReg (>= 0.2), foreach (>= 1.4), doParallel (>= 1.0),  
ggplot2 (>= 2.2), dplyr (>= 0.7), tikzDevice (>= 0.12),  
testthat (>= 2.0)

**Imports** stats (>= 3.2), utils (>= 3.2), grDevices (>= 3.2), Rdpack (>= 0.9), Rcpp (>= 0.12), purrr (>= 0.2)

**RdMacros** Rdpack

**SystemRequirements** GNU make

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**LinkingTo** Rcpp, RcppArmadillo

**RoxygenNote** 6.1.0

**NeedsCompilation** yes

**Author** Curtis Miller [aut, cre]

**Maintainer** Curtis Miller <cmiller@math.utah.edu>

---

.onAttach	<i>Package Attach Hook Function</i>
-----------	-------------------------------------

---

### Description

Hook triggered when package attached

### Usage

```
.onAttach(lib, pkg)
```

### Arguments

lib	a character string giving the library directory where the package defining the namespace was found
pkg	a character string giving the name of the package

**Examples**

```
CPAT:::.onAttach(.libPaths()[1], "CPAT")
```

---

Andrews.test

*Andrews' Test for End-of-Sample Structural Change*

---

**Description**

Performs Andrews' test for end-of-sample structural change, as described in (Andrews 2003). This function works for both univariate and multivariate data depending on the nature of `x` and whether `formula` is specified. This function is thus an interface to [andrews\\_test](#) and [andrews\\_test\\_reg](#); see the documentation of those functions for more details.

**Usage**

```
Andrews.test(x, M, formula = NULL)
```

**Arguments**

<code>x</code>	Data to test for change in mean (either a vector or <code>data.frame</code> )
<code>M</code>	Numeric index of the location of the first potential change point
<code>formula</code>	The regression formula, which will be passed to <a href="#">lm</a>

**Value**

A `htest`-class object containing the results of the test

**References**

Andrews DWK (2003). "End-of-Sample Instability Tests." *Econometrica*, **71**(6), 1661–1694. ISSN 00129682, 14680262, <https://www.jstor.org/stable/1555535>.

**Examples**

```
Andrews.test(rnorm(1000), M = 900)
x <- rnorm(1000)
y <- 1 + 2 * x + rnorm(1000)
df <- data.frame(x, y)
Andrews.test(df, y ~ x, M = 900)
```

andrews\_test

*Univariate Andrews Test for End-of-Sample Structural Change***Description**

This implements Andrews' test for end-of-sample change, as described by Andrews (2003). This test was derived for detecting a change in univariate data. See (Andrews 2003) for a description of the test.

**Usage**

```
andrews_test(x, M, pval = TRUE, stat = TRUE)
```

**Arguments**

x	Vector of the data to test
M	Numeric index of the location of the first potential change point
pval	If TRUE, return a p-value
stat	If TRUE, return a test statistic

**Value**

If both pval and stat are TRUE, a list containing both; otherwise, a number for one or the other, depending on which is TRUE

**References**

Andrews DWK (2003). "End-of-Sample Instability Tests." *Econometrica*, **71**(6), 1661–1694. ISSN 00129682, 14680262, <https://www.jstor.org/stable/1555535>.

**Examples**

```
CPAT:::andrews_test(rnorm(1000), M = 900)
```

andrews\_test\_reg

*Multivariate Andrews' Test for End-of-Sample Structural Change***Description**

This implements Andrews' test for end-of-sample change, as described by Andrews (2003). This test was derived for detecting a change in multivariate data, also originally described. See (Andrews 2003) for a description of the test.

**Usage**

```
andrews_test_reg(formula, data, M, pval = TRUE, stat = TRUE)
```

**Arguments**

formula	The regression formula, which will be passed to <code>lm</code>
data	<code>data.frame</code> containing the data
M	Numeric index of the location of the first potential change point
pval	If TRUE, return a p-value
stat	If TRUE, return a test statistic

**Value**

If both `pval` and `stat` are TRUE, a list containing both; otherwise, a number for one or the other, depending on which is TRUE

**References**

Andrews DWK (2003). “End-of-Sample Instability Tests.” *Econometrica*, **71**(6), 1661–1694. ISSN 00129682, 14680262, <https://www.jstor.org/stable/1555535>.

**Examples**

```
x <- rnorm(1000)
y <- 1 + 2 * x + rnorm(1000)
df <- data.frame(x, y)
CPAT::andrews_test_reg(y ~ x, data = df, M = 900)
```

---

banks	<i>Bank Portfolio Returns</i>
-------	-------------------------------

---

**Description**

Data set representing the returns of an industry portfolio representing the banking industry based on company four-digit SIC codes, obtained from the data library maintained by Kenneth French. Data ranges from July 1, 1926 to October 31, 2017.

**Usage**

```
banks
```

**Format**

A data frame with 24099 rows and 1 variable:

**Banks** The return of a portfolio representing the banking industry

Row names are dates in YYYY-MM-DD format.

**Source**

[http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data\\_library.html](http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data_library.html)

---

bind_power_sim_objs	<i>Power Result Data Frame Creation</i>
---------------------	---

---

### Description

Creates a `data.frame` containing power simulation results. Effectively a better, higher-level interface to `power_sim_Zn_to_df` and `power_sim_Vn_to_df`.

### Usage

```
bind_power_sim_objs(files, crit_value, conv_func, stat_name)
```

### Arguments

<code>files</code>	A character vector of file names
<code>crit_value</code>	The critical value against which to compare a test statistic
<code>conv_func</code>	The function responsible for converting a list containing simulated statistic values under different conditions to a <code>data.frame</code>
<code>stat_name</code>	The label of the statistic

### Value

A `data.frame` containing power levels

### Examples

```
## Not run:
filenames <- c("powerSimulations_sdest_norm_DE.rda",
               "powerSimulations_sdest_ar1_0.5_DE.rda")
bind_power_sim_objs(filenames, crit_value = qdarling_erdos(.95),
                    conv_func = power_sim_Vn_to_df, stat_name = "de")

## End(Not run)
```

---

CPAT_startup_message	<i>Create Package Startup Message</i>
----------------------	---------------------------------------

---

### Description

Makes package startup message.

### Usage

```
CPAT_startup_message()
```

### Examples

```
CPAT:::CPAT_startup_message()
```

---

cpt_consistent_var	<i>Variance Estimation Consistent Under Change</i>
--------------------	--

---

### Description

Estimate the variance (using the sum of squared errors) with an estimator that is consistent when the mean changes at a known point.

### Usage

```
cpt_consistent_var(x, k)
```

### Arguments

x	A numeric vector for the data set
k	The potential change point at which the data set is split

### Details

This is the estimator

$$\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$$

where  $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$  and  $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$ . In this implementation,  $T$  is computed automatically as `length(x)` and  $k$  corresponds to  $t$ , a potential change point.

### Value

The estimated change-consistent variance

### Examples

```
CPAT::cpt_consistent_var(c(rnorm(500, mean = 0), rnorm(500, mean = 1)), k = 500)
```

---

CUSUM.test	<i>CUSUM Test</i>
------------	-------------------

---

### Description

Performs the (univariate) CUSUM test for change in mean, as described in (Rice et al. ). This is effectively an interface to [stat\\_Vn](#); see its documentation for more details. p-values are computed using [pkolmogorov](#), which represents the limiting distribution of the statistic under the null hypothesis.

### Usage

```
CUSUM.test(x, use_kernel_var = FALSE, stat_plot = FALSE,
  kernel = "ba", bandwidth = "and")
```

### Arguments

x	Data to test for change in mean
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$
stat_plot	Whether to create a plot of the values of the statistic at all potential change points
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )

### Value

A htest-class object containing the results of the test

### References

Rice G, Miller C, Horváth L (???). "A new class of change point test of Rényi type." submitted.

### Examples

```
CUSUM.test(rnorm(1000))
CUSUM.test(rnorm(1000), use_kernel_var = TRUE, kernel = "bo",
            bandwidth = "nw")
```

---

DE.test

---

*Darling-Erdős Test*

---

### Description

Performs the (univariate) Darling-Erdős test for change in mean, as described in (Rice et al. ). This is effectively an interface to [stat\\_de](#); see its documentation for more details. p-values are computed using [pdarling\\_erdos](#), which represents the limiting distribution of the test statistic under the null hypothesis when a and b are chosen appropriately. (Change those parameters at your own risk!)

### Usage

```
DE.test(x, a = log, b = log, use_kernel_var = FALSE,
        stat_plot = FALSE, kernel = "ba", bandwidth = "and")
```

**Arguments**

x	Data to test for change in mean
a	The function that will be composed with $l(x) = (2 \log x)^{1/2}$
b	The function that will be composed with $u(x) = 2 \log x + \frac{1}{2} \log \log x - \frac{1}{2} \log \pi$
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$
stat_plot	Whether to create a plot of the values of the statistic at all potential change points
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )

**Value**

A htest-class object containing the results of the test

**References**

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." submitted.

**Examples**

```
DE.test(rnorm(1000))
DE.test(rnorm(1000), use_kernel_var = TRUE, kernel = "bo", bandwidth = "nw")
```

---

dist_conv_plot_tikz	<i>Create Tikz Plot Demonstrating Rényi-Type Statistic's Convergence in Distribution</i>
---------------------	--

---

**Description**

Create a Tikz file containing a plot demonstrating that the Rényi-type statistic converges in distribution. Optionally, create a PDF as well.

**Usage**

```
dist_conv_plot_tikz(obj, dist, trim, size, title = "", width = 4,
  height = 3, filename = NULL, makePDF = TRUE, verbose = TRUE)
```

**Arguments**

obj	The list containing the simulations
dist	The identifier of the data-generating process that generated the datasets on which the Rényi-type statistic was computed
trim	The identifier of the trimming parameter of the Rényi-type statistic
size	The sample size of the simulated data sets
title	The title of the plot
width	The width of the plot
height	The height of the plot
filename	The name of the output file (without extensions; .tex and maybe .pdf files will be created); if NULL, the name will automatically be determined (of the form dist_conv_dist_nsize_trim)
makePDF	Automatically compile the resulting .tex file
verbose	Print updates about progress (via link[base]{cat})

**Examples**

```
## Not run:
ZnSimulations <- list(
  "norm" = list(
    "log" = list(
      "n500" = c(3.206, 1.32, 0.776, 1.262, 0.676)
    )
  )
)
dist_conv_plot_tikz(ZnSimulations, "norm", "log", 500)

## End(Not run)
```

dZn

*Rényi-Type Statistic Limiting Distribution Density Function***Description**

Function for computing the value of the density function of the limiting distribution of the Rényi-type statistic.

**Usage**

```
dZn(x, summands = NULL)
```

**Arguments**

x	Point at which to evaluate the density function (note that this parameter is not vectorized)
summands	Number of summands to use in summation (the default should be machine accurate)

**Value**

Value of the density function at  $x$

**Examples**

CPAT:::dZn(1)

---

ff	<i>Fama-French Five Factors</i>
----	---------------------------------

---

**Description**

Data set containing the five factors described by Fama and French (2015), from the data library maintained by Kenneth French. Data ranges from July 1, 1963 to October 31, 2017.

**Usage**

ff

**Format**

A data frame with 13679 rows and 6 variables:

**Mkt.RF** Market excess returns

**RF** The risk-free rate of return

**SMB** The return on a diversified portfolio of small stocks minus return on a diversified portfolio of big stocks

**HML** The return of a portfolio of stocks with a high book-to-market (B/M) ratio minus the return of a portfolio of stocks with a low B/M ratio

**RMW** The return of a portfolio of stocks with robust profitability minus a portfolio of stocks with weak profitability

**CMA** The return of a portfolio of stocks with conservative investment minus the return of a portfolio of stocks with aggressive investment

Row names are dates in YYYYMMDD format.

**Source**

[http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data\\_library.html](http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data_library.html)

---

getLongRunWeights	<i>Weights for Long-Run Variance</i>
-------------------	--------------------------------------

---

### Description

Compute some weights for long-run variance. This code comes directly from the source code of **cointReg**; see [getLongRunWeights](#).

### Usage

```
getLongRunWeights(n, bandwidth, kernel = "ba")
```

### Arguments

n	Length of weights' vector
bandwidth	A number for the bandwidth
kernel	The kernel function; see <a href="#">getLongRunVar</a> for possible values

### Value

List with components w containing the vector of weights and upper, the index of the largest non-zero entry in w

### Examples

```
CPAT:::getLongRunWeights(10, 1)
```

---

get_expanding_window_pvals	<i>Expanding Window p-Values</i>
----------------------------	----------------------------------

---

### Description

Gets p-values for the CUSUM, Darling-Erdős, Hidalgo-Seo, Andrews, and Rényi-type tests when applied to an expanding window of data.

### Usage

```
get_expanding_window_pvals(dat, m = Inf)
```

### Arguments

dat	The dataset for which to test for change in mean
m	The location of the first potential change point for Andrews' test

### Value

A matrix containing p-values for an expanding sample size, with each row corresponding to one observation larger; columns are labeled for each statistic

**Examples**

```
if (require("foreach") & require("doParallel")) {
  CPAT::get_expanding_window_pvals(rnorm(1000), m = 900)
}
```

---

get\_expanding\_window\_pvals\_reg

*Expanding Window p-Values for Regression Models*

---

**Description**

Gets p-values for the CUSUM, Darling-Erdős, Hidalgo-Seo, Andrews, and Rényi-type tests when applied to an expanding window of data for a regression model.

**Usage**

```
get_expanding_window_pvals_reg(formula, data, min_n = 3, m = Inf,
  verbose = FALSE)
```

**Arguments**

formula	The regression model formula, which will be passed to <a href="#">lm</a>
data	A <code>data.frame</code> , the dataset for which to test for structural change
min_n	An integer; the minimum sample size
m	The location of the first potential change point for Andrews' test
verbose	If TRUE, send messages to output

**Value**

A matrix containing p-values for an expanding sample size, with each row corresponding to one observation larger; columns are labeled for each statistic

**Examples**

```
x <- rnorm(1000)
y <- 1 + 2 * x + rnorm(1000)
df <- data.frame(x, y)
if (require("foreach") & require("doParallel")) {
  CPAT::get_expanding_window_pvals_reg(y ~ x, data = df, min_n = 4, m = 900)
}
```

get\_lrv\_vec

*Long-Run Variance Estimation With Possible Change Points***Description**

Computes the estimates of the long-run variance in a change point context, as described in (Rice et al. ). By default it uses kernel and bandwidth selection as used in the package **cointReg**, though changing the parameters `kernel` and `bandwidth` can change this behavior. If **cointReg** is not installed, the Bartlett internal (defined internally) will be used and the bandwidth will be the square root of the sample size.

**Usage**

```
get_lrv_vec(dat, kernel = "ba", bandwidth = "and")
```

**Arguments**

<code>dat</code>	The data vector
<code>kernel</code>	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
<code>bandwidth</code>	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )

**Value**

A vector of estimates of the long-run variance

**References**

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." submitted.

**Examples**

```
x <- rnorm(1000)
CPAT:::get_lrv_vec(x)
CPAT:::get_lrv_vec(x, kernel = "pa", bandwidth = "nw")
```

HR.test

*Rényi-Type Test***Description**

Performs the (univariate) Rényi-type test for change in mean, as described in (Rice et al. ). This is effectively an interface to [stat\\_Zn](#); see its documentation for more details. p-values are computed using [pZn](#), which represents the limiting distribution of the test statistic under the null hypothesis, which represents the limiting distribution of the test statistic under the null hypothesis when  $k_n$  represents a sequence  $t_T$  satisfying  $t_T \rightarrow \infty$  and  $t_T/T \rightarrow 0$  as  $T \rightarrow \infty$ . ([log](#) and [sqrt](#) should be good choices.)

**Usage**

```
HR.test(x, kn = log, use_kernel_var = FALSE, stat_plot = FALSE,
        kernel = "ba", bandwidth = "and")
```

**Arguments**

x	Data to test for change in mean
kn	A function corresponding to the trimming parameter $t_T$ ; by default, the square root function
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$ ; if custom_var is not NULL, this argument is ignored
stat_plot	Whether to create a plot of the values of the statistic at all potential change points
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )

**Value**

A htest-class object containing the results of the test

**References**

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." submitted.

**Examples**

```
HR.test(rnorm(1000))
HR.test(rnorm(1000), use_kernel_var = TRUE, kernel = "bo", bandwidth = "nw")
```

---

HS.test

*Hidalgo-Seo Test*

---

**Description**

Performs the (univariate) Hidalgo-Seo test for change in mean, as described in (Rice et al. ). This is effectively an interface to [stat\\_hs](#); see its documentation for more details. p-values are computed using [phidalgo\\_seo](#), which represents the limiting distribution of the test statistic when the null hypothesis is true.

**Usage**

```
HS.test(x, corr = TRUE, stat_plot = FALSE)
```

**Arguments**

x	Data to test for change in mean
corr	If TRUE, the long-run variance will be computed under the assumption of correlated residuals; ignored if custom_var is not NULL or use_kernel_var is TRUE
stat_plot	Whether to create a plot of the values of the statistic at all potential change points

**Value**

A htest-class object containing the results of the test

**References**

Rice G, Miller C, Horváth L (???). “A new class of change point test of Rényi type.” submitted.

**Examples**

```
HS.test(rnorm(1000))
HS.test(rnorm(1000), corr = FALSE)
```

---

lrv\_plot\_tikz

---

*Long-Run Variance Estimation Simulations Plot*

---

**Description**

Create a Tikz plot of the estimated distribution of LRV estimators

**Usage**

```
lrv_plot_tikz(data, n, ker_name, true_lrv, phi = NULL, xrange = NULL,
  width = 4.5, height = 3.5, filename = NULL, verbose = FALSE,
  makePDF = TRUE)
```

**Arguments**

data	A data.frame containing the data to plot
n	The sample size of simulated data sets for which to plot an estimated distribution
ker_name	The name of the kernel function used in the LRV estimator
true_lrv	The value of the true long-run variance
phi	The autocorrelation parameter of the simulated data sets to plot; if NULL, the data is assumed to have been generated with a GARCH(1,1) process
xrange	The limits of the horizontal axis of the plot
width	The width of the plot
height	The height of the plot
filename	The name of the file to save output (without stems; files with this string appended with .tex and maybe .pdf will be created); if NULL, a file name will automatically be chosen (of the form lrv_est_plot_ker_name_phi)
verbose	Print updates about progress (via link[base]{cat})
makePDF	Automatically compile the resulting .tex file

### Examples

```
## Not run:
plotlist <- data.frame(val = c(0.649, 0.965, 0.905),
                        n   = c(50,    50,    50),
                        phi = c(0,     0,     0))
lrv_plot_tikz(plotlist, 50, ker_name = "bartlett", true_lrv = 1)

## End(Not run)

---

pdarling_erdos	<i>Darling-Erdős Statistic CDF</i>
----------------	------------------------------------

---

### Description

CDF for the limiting distribution of the Darling-Erdős statistic.

### Usage

```
pdarling_erdos(q)
```

### Arguments

q                      Quantile input to CDF

### Value

If  $Z$  is the random variable with this distribution, the quantity  $P(Z \leq q)$

### Examples

```
CPAT:::pdarling_erdos(0.1)
```

---

phidalgo_seo	<i>Hidalgo-Seo Statistic CDF</i>
--------------	----------------------------------

---

### Description

CDF of the limiting distribution of the Hidalgo-Seo statistic

### Usage

```
phidalgo_seo(q)
```

### Arguments

q                      Quantile input to CDF

### Value

If  $Z$  is the random variable following the limiting distribution, the quantity  $P(Z \leq q)$

**Examples**

```
CPAT:::phidalgo_seo(0.1)
```

---

pkolmogorov

*Kolmogorov CDF*

---

**Description**

CDF of the Kolmogorov distribution.

**Usage**

```
pkolmogorov(q, summands = ceiling(q * sqrt(72) + 3/2))
```

**Arguments**

q	Quantile input to CDF
summands	Number of summands for infinite sum (the default should have machine accuracy)

**Value**

If  $Z$  is the random variable following the Kolmogorov distribution, the quantity  $P(Z \leq q)$

**Examples**

```
CPAT:::pkolmogorov(0.1)
```

---

power\_plot\_tikz

*Power Curve Plot (By Statistic)*

---

**Description**

Create a Tikz plot of the power curves of a statistic, with each sample size having its own curve.

**Usage**

```
power_plot_tikz(data, d, t, c, s, title = "", legend_pos = "none",
  width = 4.5, height = 3.5, filename = NULL, verbose = FALSE,
  makePDF = TRUE)
```

**Arguments**

data	A data.frame containing the data to plot
d	Label for data-generating process used to simulate the data on which the statistics were computed
t	Label for the trimming parameter of the Rényi-type statistic
c	Label for the process that computes the location of change points
s	The statistic for which to plot a power curve
title	The title of the plot
legend_pos	A string to be passed to <code>link[ggplot2]{theme}</code> (the <code>legend.position</code> argument) identifying where to place the legend
width	The width of the plot
height	The height of the plot
filename	The name of the file to save output (without stems; files with this string appended with <code>.tex</code> and maybe <code>.pdf</code> will be created); if <code>NULL</code> , the name will be automatically determined
verbose	Print updates about progress (via <code>link[base]{cat}</code> )
makePDF	Automatically compile the resulting <code>.tex</code> file

**Examples**

```
## Not run:
pdat <- data.frame(power = c(0.8926, 0.8714, 0.8296, 0.7936),
  stat = c("de", "de", "de", "de"),
  dist = c("norm", "norm", "norm", "norm"),
  kn = c("log", "log", "log", "log"),
  n = c(50, 50, 50, 50),
  cpt = c("c4rt", "c4rt", "c4rt", "c4rt"),
  delta = c(-2.0, -1.9, -1.8, -1.7))
power_plot_tikz(pdat, "norm", "log", "c4rt", "de")

## End(Not run)
```

---

power\_plot\_tikz\_by\_n    *Power Curve Plot*

---

**Description**

Create a Tikz plot of the power curves of simulated statistics.

**Usage**

```
power_plot_tikz_by_n(data, d, t, c, N, statlines, title = "",
  legend_pos = "none", width = 4.5, height = 3.5, filename = NULL,
  verbose = FALSE, makePDF = TRUE)
```

**Arguments**

data	A data.frame containing the data to plot
d	Label for data-generating process used to simulate the data on which the statistics were computed
t	Label for the trimming parameter of the Rényi-type statistic
c	Label for the process that computes the location of change points
N	The sample size of the simulated data sets on which the statistics were computed
statlines	A character vector where the names of the entries are the labels of the statistics in the stat column of data and the entries define the line types used by the values entry of <a href="#">scale_linetype_manual</a>
title	The title of the plot
legend_pos	A string to be passed to <code>link[ggplot2]{theme}</code> (the <code>legend.position</code> argument) identifying where to place the legend
width	The width of the plot
height	The height of the plot
filename	The name of the file to save output (without stems; files with this string appended with .tex and maybe .pdf will be created); if NULL, the name will be automatically determined
verbose	Print updates about progress (via <code>link[base]{cat}</code> )
makePDF	Automatically compile the resulting .tex file

**Examples**

```
## Not run:
pdat <- data.frame(power = c(0.8926, 0.8714, 0.8296, 0.7936),
  stat = c("de", "de", "de", "de"),
  dist = c("norm", "norm", "norm", "norm"),
  kn = c("log", "log", "log", "log"),
  n = c(50, 50, 50, 50),
  cpt = c("c4rt", "c4rt", "c4rt", "c4rt"),
  delta = c(-2.0, -1.9, -1.8, -1.7))
power_plot_tikz_by_n(pdat, "norm", "log", "c4rt", 50, c("de" = "solid"))

## End(Not run)
```

---

```
power_sim_stat_df_creator
```

*Create Power Simulation Results Data Frame*

---

**Description**

Creates a data.frame that contains power simulation results from files containing power simulations. This function should automate the use of [power\\_sim\\_Zn\\_to\\_df](#) and [power\\_sim\\_Vn\\_to\\_df](#) for collecting power simulation data. It takes two CSV files, one passed (as a character string) to `file_meta` and the other to `stat_meta`, describing how the files (named and described in `file_meta`) should be handled.

**Usage**

```
power_sim_stat_df_creator(file_meta, stat_meta, prefix = "",
                          alpha = 0.05)
```

**Arguments**

file_meta	The location of a CSV file that contains file names and the statistics that those files correspond to
stat_meta	The location of a CSV file that contains statistic (stat) labels (used in file_meta), the name of the variable for the statistic, and the name of the function that converts a file (mentioned in file_meta) to a data.frame of power data
prefix	Character string representing a prefix for file names mentioned in file_meta; could be used for adding path information to those names, in case the files are not in the working directory and there is no desire to edit file_meta's data
alpha	Numeric for level of significance used in power calculations

**Value**

A data frame containing the power simulation data

**Examples**

```
## Not run:
power_sim_stat_df_creator("FileStatMeta.csv", "StatMeta.csv")

## End(Not run)
```

---

power_sim_Vn_to_df	<i>Convert CUSUM-Type Statistic Power Simulation Save List to Data Frame</i>
--------------------	--

---

**Description**

This function will convert the power simulation data generated in a list in our simulation scripts to a data.frame. Given such a list and a critical value to determine whether the null hypothesis should be rejected, the function will return a data.frame with columns power, stat, dist, n, cpt, and delta, which correspond to: the empirical power of the statistic; the identifier of the statistic; the generating distribution of the statistic was computed on; the identifier of how change points were computed; and the size of the change.

**Usage**

```
power_sim_Vn_to_df(obj, crit)
```

**Arguments**

obj	A list containing simulated statistic values
crit	The critical value determining whether a statistic should lead to the rejection of the null hypothesis

**Value**

A `data.frame` summarizing the results of the data stored in `obj`

**Examples**

```
saveobj <- list("norm" = list(
  "n50" = list(
    "c4rt" = list(
      "d_0" = c(1.551, 1.276, 1.348, 1.982, 1.423)
    )
  )
))
CPAT:::power_sim_Vn_to_df(saveobj, CPAT:::qkolmogorov(.95))
```

---

power_sim_Zn_to_df	<i>Convert Rényi-Type Statistic Power Simulation Save List to Data Frame</i>
--------------------	--

---

**Description**

This function will convert the power simulation data generated in a list in our simulation scripts to a `data.frame`. Given such a list and a critical value to determine whether the null hypothesis should be rejected, the function will return a `data.frame` with columns `power`, `stat`, `dist`, `kn`, `n`, `cpt`, and `delta`, which correspond to: the empirical power of the statistic; the identifier of the statistic; the generating distribution of the statistic was computed on; the `kn` parameter; the identifier of how change points were computed; and the size of the change.

**Usage**

```
power_sim_Zn_to_df(obj, crit)
```

**Arguments**

<code>obj</code>	A list containing simulated statistic values
<code>crit</code>	The critical value determining whether a statistic should lead to the rejection of the null hypothesis

**Value**

A `data.frame` summarizing the results of the data stored in `obj`

**Examples**

```
saveobj <- list("norm" = list(
  "log" = list(
    "n50" = list(
      "c4rt" = list(
        "d_0" = c(1.551, 1.276, 1.348, 1.982, 1.423)
      )
    )
  )
))
CPAT:::power_sim_Zn_to_df(saveobj, CPAT:::qZn(.95))
```

---

pZn	<i>Rènyi-Type Statistic CDF</i>
-----	---------------------------------

---

**Description**

CDF for the limiting distribution of the Rènyi-type statistic.

**Usage**

```
pZn(q, summands = NULL)
```

**Arguments**

q	Quantile input to CDF
summands	Number of summands for infinite sum; if NULL, automatically determined

**Value**

If  $Z$  is the random variable following the limiting distribution, the quantity  $P(Z \leq q)$

**Examples**

```
CPAT:::pZn(0.1)
```

---

qdarling_erdos	<i>Darling-Erdős Statistic Limiting Distribution Quantile Function</i>
----------------	--

---

**Description**

Quantile function for the limiting distribution of the Darling-Erdős statistic.

**Usage**

```
qdarling_erdos(p)
```

**Arguments**

p	The probability associated with the desired quantile
---	--

**Value**

The quantile associated with p

**Examples**

```
CPAT:::qdarling_erdos(0.5)
```

qhidalgo\_seo

*Hidalgo-Seo Statistic Limiting Distribution Quantile Function***Description**

Quantile function for the limiting distribution of the Hidalgo-Seo statistic

**Usage**

```
qhidalgo_seo(p)
```

**Arguments**

p                      The probability associated with the desired quantile

**Value**

A The quantile associated with p

**Examples**

```
CPAT:::qhidalgo_seo(0.5)
```

qkolmogorov

*Kolmogorov Distribution Quantile Function***Description**

Quantile function for the Kolmogorov distribution.

**Usage**

```
qkolmogorov(p, summands = 500, interval = c(0, 100),
  tol = .Machine$double.eps, ...)
```

**Arguments**

p                      Value of the CDF at the quantile  
 summands              Number of summands for infinite sum  
 interval, tol, ...      Arguments to be passed to [uniroot](#)

**Details**

This function uses [uniroot](#) for finding this quantity, and many of the the accepted parameters are arguments for that function; see its documentation for more details.

**Value**

The quantile associated with p

**Examples**

```
CPAT::qkolmogorov(0.5)
```

---

qZn	<i>Rènyi-Type Statistic Quantile Function</i>
-----	---

---

**Description**

Quantile function for the limiting distribution of the Rènyi-type statistic.

**Usage**

```
qZn(p, summands = 500, interval = c(0, 100),
    tol = .Machine$double.eps, ...)
```

**Arguments**

p	Value of the CDF at the quantile
summands	Number of summands for infinite sum
interval, tol, ...	Arguments to be passed to <a href="#">uniroot</a>

**Details**

This function uses [uniroot](#) for finding this quantity, and many of the the accepted parameters are arguments for that function; see its documentation for more details.

**Value**

The quantile associated with p

**Examples**

```
CPAT::qZn(0.5)
```

---

rchangeoint	<i>Simulate Univariate Data With a Single Change Point</i>
-------------	--

---

**Description**

This function simulates univariate data with a structural change.

**Usage**

```
rchangeoint(n, changepoint = NULL, mean1 = 0, mean2 = 0,
    dist = rnorm, meanparam = "mean", ...)
```

**Arguments**

n	An integer for the data set's sample size
changepoint	An integer for where the change point occurs
mean1	The mean prior to the change point
mean2	The mean after the change point
dist	The function with which random data will be generated
meanparam	A string for the parameter in dist representing the mean
...	Other arguments to be passed to dist

**Details**

This function generates artificial change point data, where up to the specified change point the data has one mean, and after the point it has a different mean. By default, the function simulates standard Normal data with no change. If changepoint is NULL, then by default the change point will be at about the middle of the data.

**Value**

A vector of the simulated data

**Examples**

```
CPAT:::rchangepoint(500)
CPAT:::rchangepoint(500, changepoint = 10, mean2 = 2, sd = 2)
CPAT:::rchangepoint(500, changepoint = 250, dist = rexp, meanparam = "rate",
                    mean1 = 1, mean2 = 2)
```

---

sim\_de\_stat

---

*Darling-Erdős Statistic Simulation*

---

**Description**

Simulates multiple realizations of the Darling-Erdős statistic.

**Usage**

```
sim_de_stat(size, a = log, b = log, use_kernel_var = FALSE,
            kernel = "ba", bandwidth = "and", n = 500, gen_func = rnorm,
            args = NULL, parallel = FALSE)
```

**Arguments**

size	Number of realizations to simulate
a	The function that will be composed with $l(x) = (2 \log(x))^{1/2}$
b	The function that will be composed with $u(x) = 2 \log(x) + \frac{1}{2} \log(\log(x)) - \frac{1}{2} \log(\pi)$
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed)

kernel	If character, the identifier of the kernel function as used in the <b>cointReg</b> (see documentation for <code>cointReg::getLongRunVar</code> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> ); this parameter has no effect if <code>use_kernel_var</code> is FALSE
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the <b>cointReg</b> package (see documentation for <code>cointReg::getLongRunVar</code> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the Andrews (1991) method, as used in <b>cointReg</b> ); this parameter has no effect if <code>use_kernel_var</code> is FALSE
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to <code>gen_func</code>
parallel	Whether to use the <b>foreach</b> and <b>doParallel</b> packages to parallelize simulation (which needs to be initialized in the global namespace before use)

### Details

If `use_kernel_var` is set to TRUE, long-run variance estimation using kernel-based techniques will be employed; otherwise, a technique resembling standard variance estimation will be employed. Any technique employed, though, will account for the potential break points, as described in Rice et al. (). See the documentation for [stat\\_de](#) for more details.

The parameters `kernel` and `bandwidth` control parameters for long-run variance estimation using kernel methods. These parameters will be passed directly to [stat\\_de](#).

### Value

A vector of simulated realizations of the Darling-Erdős statistic

### References

Andrews DWK (1991). “Heteroskedasticity and Autocorrelation Consistent Covariance Matrix Estimation.” *Econometrica*, **59**(3), 817-858.

Rice G, Miller C, Horváth L (????). “A new class of change point test of Rényi type.” submitted.

### Examples

```
CPAT::sim_de_stat(100)
CPAT::sim_de_stat(100, use_kernel_var = TRUE,
  gen_func = CPAT::rchangepoint,
  args = list(changepoint = 250, mean2 = 1))
```

---

sim\_hs\_stat

Hidalgo-Seo Statistic Simulation

---

### Description

Simulates multiple realizations of the Hidalgo-Seo statistic.

## Usage

```
sim_hs_stat(size, corr = TRUE, gen_func = rnorm, args = NULL,
            n = 500, parallel = FALSE, use_kernel_var = FALSE, kernel = "ba",
            bandwidth = "and")
```

## Arguments

size	Number of realizations to simulate
corr	Whether long-run variance should be computed under the assumption of correlated residuals
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to gen_func
n	The sample size for each realization
parallel	Whether to use the <b>foreach</b> and <b>doParallel</b> packages to parallelize simulation (which needs to be initialized in the global namespace before use)
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed); <i>TODO: NOT CURRENTLY IMPLEMENTED</i>
kernel	If character, the identifier of the kernel function as used in the <b>cointReg</b> (see documentation for <code>cointReg::getLongRunVar</code> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> ); this parameter has no effect if use_kernel_var is FALSE; <i>TODO: NOT CURRENTLY IMPLEMENTED</i>
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the <b>cointReg</b> package (see documentation for <code>cointReg::getLongRunVar</code> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the Andrews (1991) method, as used in <b>cointReg</b> ); this parameter has no effect if use_kernel_var is FALSE; <i>TODO: NOT CURRENTLY IMPLEMENTED</i>

## Details

If corr is TRUE, then the residuals of the data-generating process are assumed to be correlated and the test accounts for this in long-run variance estimation; see the documentation for [stat\\_hs](#) for more details. Otherwise, the sample variance is the estimate for the long-run variance, as described in Hidalgo and Seo (2013).

## Value

A vector of simulated realizations of the Hidalgo-Seo statistic

---

sim_Vn	<i>CUSUM Statistic Simulation (Assuming Variance)</i>
--------	---

---

**Description**

Simulates multiple realizations of the CUSUM statistic when the long-run variance of the data is known.

**Usage**

```
sim_Vn(size, n = 500, gen_func = rnorm, sd = 1, args = NULL)
```

**Arguments**

size	Number of realizations to simulate
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
sd	The square root of the second moment of the data
args	A list of arguments to be passed to gen_func

**Value**

A vector of simulated realizations of the CUSUM statistic

**Examples**

```
CPAT:::sim_Vn(100)
CPAT:::sim_Vn(100, gen_func = CPAT:::rchangeoint,
  args = list(changepoint = 250, mean2 = 1))
```

---

sim_Vn_stat	<i>CUSUM Statistic Simulation</i>
-------------	-----------------------------------

---

**Description**

Simulates multiple realizations of the CUSUM statistic.

**Usage**

```
sim_Vn_stat(size, kn = function(n) { 1 }, tau = 0,
  use_kernel_var = FALSE, kernel = "ba", bandwidth = "and",
  n = 500, gen_func = rnorm, args = NULL, parallel = FALSE)
```

## Arguments

size	Number of realizations to simulate
kn	A function returning a positive integer that is used in the definition of the trimmed CUSUM statistic effectively setting the bounds over which the maximum is taken
tau	The weighting parameter for the weighted CUSUM statistic (defaults to zero for no weighting)
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed)
kernel	If character, the identifier of the kernel function as used in the <b>cointReg</b> (see documentation for <code>cointReg::getLongRunVar</code> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> ); this parameter has no effect if <code>use_kernel_var</code> is FALSE
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the <b>cointReg</b> package (see documentation for <code>cointReg::getLongRunVar</code> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the method described in (Andrews 1991), as used in <b>cointReg</b> ); this parameter has no effect if <code>use_kernel_var</code> is FALSE
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to <code>gen_func</code>
parallel	Whether to use the <b>foreach</b> and <b>doParallel</b> packages to parallelize simulation (which needs to be initialized in the global namespace before use)

## Details

This differs from `sim_Vn()` in that the long-run variance is estimated with this function, while `sim_Vn()` assumes the long-run variance is known. Estimation can be done in a variety of ways. If `use_kernel_var` is set to TRUE, long-run variance estimation using kernel-based techniques will be employed; otherwise, a technique resembling standard variance estimation will be employed. Any technique employed, though, will account for the potential break points, as described in Rice et al. (). See the documentation for [stat\\_Vn](#) for more details.

The parameters `kernel` and `bandwidth` control parameters for long-run variance estimation using kernel methods. These parameters will be passed directly to [stat\\_Vn](#).

Versions of the CUSUM statistic, such as the weighted or trimmed statistics, can be simulated with the function by passing values to `kn` and `tau`; again, see the documentation for [stat\\_Vn](#).

## Value

A vector of simulated realizations of the CUSUM statistic

## References

**Examples**

```
CPAT::sim_Vn_stat(100)
CPAT::sim_Vn_stat(100, kn = function(n) {floor(0.1 * n)}, tau = 1/3,
  use_kernel_var = TRUE, gen_func = CPAT::rchangeoint,
  args = list(changepoint = 250, mean2 = 1))
```

---

sim_Zn	<i>Rènyi-Type Statistic Simulation (Assuming Variance)</i>
--------	--

---

**Description**

Simulates multiple realizations of the Rènyi-type statistic when the long-run variance of the data is known.

**Usage**

```
sim_Zn(size, kn, n = 500, gen_func = rnorm, args = NULL, sd = 1)
```

**Arguments**

size	Number of realizations to simulate
kn	A function returning a positive integer that is used in the definition of the Rènyi-type statistic effectively setting the bounds over which the maximum is taken
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to gen_func
sd	The square root of the second moment of the data

**Value**

A vector of simulated realizations of the Rènyi-type statistic

**Examples**

```
CPAT::sim_Zn(100, kn = function(n) {floor(log(n))})
CPAT::sim_Zn(100, kn = function(n) {floor(log(n))},
  gen_func = CPAT::rchangeoint, args = list(changepoint = 250,
  mean2 = 1))
```

sim\_Zn\_stat

*Rènyi-Type Statistic Simulation***Description**

Simulates multiple realizations of the Rènyi-type statistic.

**Usage**

```
sim_Zn_stat(size, kn = function(n) { floor(sqrt(n)) },
  use_kernel_var = FALSE, kernel = "ba", bandwidth = "and",
  n = 500, gen_func = rnorm, args = NULL, parallel = FALSE)
```

**Arguments**

size	Number of realizations to simulate
kn	A function returning a positive integer that is used in the definition of the Rènyi-type statistic effectively setting the bounds over which the maximum is taken
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed)
kernel	If character, the identifier of the kernel function as used in the <b>cointReg</b> (see documentation for <code>cointReg::getLongRunVar</code> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> ); this parameter has no effect if <code>use_kernel_var</code> is FALSE
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the <b>cointReg</b> package (see documentation for <code>cointReg::getLongRunVar</code> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the Andrews (1991) method, as used in <b>cointReg</b> ); this parameter has no effect if <code>use_kernel_var</code> is FALSE
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to <code>gen_func</code>

## Examples

```
CPAT:::sim_Zn_stat(100)
CPAT:::sim_Zn_stat(100, kn = function(n) {floor(log(n))},
  use_kernel_var = TRUE, gen_func = CPAT:::rchangeoint,
  args = list(changeoint = 250, mean2 = 1))
```

---

stat_de	<i>Compute the Darling-Erdős Statistic</i>
---------	--

---

## Description

This function computes the Darling-Erdős statistic.

## Usage

```
stat_de(dat, a = log, b = log, estimate = FALSE,
  use_kernel_var = FALSE, custom_var = NULL, kernel = "ba",
  bandwidth = "and", get_all_vals = FALSE)
```

## Arguments

dat	The data vector
a	The function that will be composed with $l(x) = (2 \log x)^{1/2}$
b	The function that will be composed with $u(x) = 2 \log x + \frac{1}{2} \log \log x - \frac{1}{2} \log \pi$
estimate	Set to TRUE to return the estimated location of the change point
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$
custom_var	Can be a vector the same length as dat consisting of variance-like numbers at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occurred) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential change point; if NULL, this argument is ignored
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )
get_all_vals	If TRUE, return all values for the statistic at every tested point in the data set

## Details

If  $\bar{A}_T(\tau, t_T)$  is the weighted and trimmed CUSUM statistic with weighting parameter  $\tau$  and trimming parameter  $t_T$  (see [stat\\_Vn](#)), then the Darling-Erdős statistic is

$$l(a_T)\bar{A}_T(1/2, 1) - u(b_T)$$

with  $l(x) = \sqrt{2\log x}$  and  $u(x) = 2\log x + \frac{1}{2}\log\log x - \frac{1}{2}\log\pi$  ( $\log x$  is the natural logarithm of  $x$ ). The parameter  $a$  corresponds to  $a_T$  and  $b$  to  $b_T$ ; these are both `log` by default.

See (Rice et al. ) to learn more.

## Value

If both `estimate` and `get_all_vals` are `FALSE`, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are `TRUE`, the test statistic is in the first position and the estimated changg point in the second)

## References

Rice G, Miller C, Horváth L (???). “A new class of change point test of Rényi type.” submitted.

## Examples

```
CPAT:::stat_de(rnorm(1000))
CPAT:::stat_de(rnorm(1000), use_kernel_var = TRUE, bandwidth = "nw", kernel = "bo")
```

---

stat\_hs

---

*Compute the Hidalgo-Seo Statistic*

---

## Description

This function computes the Hidalgo-Seo statistic for a change in mean model.

## Usage

```
stat_hs(dat, estimate = FALSE, corr = TRUE, get_all_vals = FALSE,
        custom_var = NULL, use_kernel_var = FALSE, kernel = "ba",
        bandwidth = "and")
```

## Arguments

<code>dat</code>	The data vector
<code>estimate</code>	Set to <code>TRUE</code> to return the estimated location of the change point
<code>corr</code>	If <code>TRUE</code> , the long-run variance will be computed under the assumption of correlated residuals; ignored if <code>custom_var</code> is not <code>NULL</code> or <code>use_kernel_var</code> is <code>TRUE</code>
<code>get_all_vals</code>	If <code>TRUE</code> , return all values for the statistic at every tested point in the data set
<code>custom_var</code>	Can be a vector the same length as <code>dat</code> consisting of variance-like numbers at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occurred) or a function taking two parameters <code>x</code> and <code>k</code> that can be used to generate this vector, with <code>x</code> representing the data vector and <code>k</code> the position of a potential change point; if <code>NULL</code> , this argument is ignored

use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$ ; if custom_var is not NULL, this argument is ignored
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )

## Details

For a data set  $x_t$  with  $n$  observations, the test statistic is

$$\max_{1 \leq s \leq n-1} (\mathcal{LM}(s) - B_n) / A_n$$

where  $\hat{u}_t = x_t - \bar{x}$  ( $\bar{x}$  is the sample mean),  $a_n = (2 \log \log n)^{1/2}$ ,  $b_n = a_n^2 - \frac{1}{2} \log \log \log n - \log \Gamma(1/2)$ ,  $A_n = b_n / a_n^2$ ,  $B_n = b_n^2 / a_n^2$ ,  $\hat{\Delta} = \hat{\sigma}^2 = n^{-1} \sum_{t=1}^n \hat{u}_t^2$ , and  $\mathcal{LM}(s) = n(n-s)^{-1} s^{-1} \hat{\Delta}^{-1} (\sum_{t=1}^s \hat{u}_t)^2$ .

If corr is FALSE, then the residuals are assumed to be uncorrelated. Otherwise, the residuals are assumed to be correlated and  $\hat{\Delta} = \hat{\gamma}(0) + 2 \sum_{j=1}^{\lfloor \sqrt{n} \rfloor} (1 - \frac{j}{\sqrt{n}}) \hat{\gamma}(j)$  with  $\hat{\gamma}(j) = \frac{1}{n} \sum_{t=1}^{n-j} \hat{u}_t \hat{u}_{t+j}$ .

This statistic was presented in (Hidalgo and Seo 2013).

## Value

If both estimate and get\_all\_vals are FALSE, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are TRUE, the test statistic is in the first position and the estimated change point in the second)

## Examples

```
CPAT:::stat_hs(rnorm(1000))
CPAT:::stat_hs(rnorm(1000), corr = FALSE)
```

stat\_Vn

*Compute the CUSUM Statistic***Description**

This function computes the CUSUM statistic (and can compute weighted/trimmed variants, depending on the values of kn and tau).

**Usage**

```
stat_Vn(dat, kn = function(n) { 1 }, tau = 0, estimate = FALSE,
        use_kernel_var = FALSE, custom_var = NULL, kernel = "ba",
        bandwidth = "and", get_all_vals = FALSE)
```

**Arguments**

dat	The data vector
kn	A function corresponding to the trimming parameter $t_T$ in the trimmed CUSUM variant; by default, is a function returning 1 (for no trimming)
tau	The weighting parameter $\tau$ for the weighted CUSUM statistic; by default, is 0 (for no weighting)
estimate	Set to TRUE to return the estimated location of the change point
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$
custom_var	Can be a vector the same length as dat consisting of variance-like numbers at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occurred) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential change point; if NULL, this argument is ignored
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )
get_all_vals	If TRUE, return all values for the statistic at every tested point in the data set

**Details**

The definition of the statistic is

$$T^{-1/2} \max_{1 \leq t \leq T} \hat{\sigma}_{t,T}^{-1} \left| \sum_{s=1}^t X_s - \frac{t}{T} \sum_{s=1}^T X_s \right|$$

A more general version is

$$T^{-1/2} \max_{t_T \leq t \leq T-t_T} \hat{\sigma}_{t,T}^{-1} \left( \frac{t}{T} \left( \frac{T-t}{T} \right) \right)^\tau \left| \sum_{s=1}^t X_s - \frac{t}{T} \sum_{s=1}^T X_s \right|$$

The parameter `kn` corresponds to the trimming parameter  $t_T$  and the parameter `tau` corresponds to  $\tau$ .

See (Rice et al. ) for more details.

### Value

If both `estimate` and `get_all_vals` are `FALSE`, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are `TRUE`, the test statistic is in the first position and the estimated change point in the second)

### References

Rice G, Miller C, Horváth L (????). “A new class of change point test of Rényi type.” submitted.

### Examples

```
CPAT:::stat_Vn(rnorm(1000))
CPAT:::stat_Vn(rnorm(1000), kn = function(n) {0.1 * n}, tau = 1/2)
CPAT:::stat_Vn(rnorm(1000), use_kernel_var = TRUE, bandwidth = "nw", kernel = "bo")
```

---

stat_Zn	<i>Compute the Rényi-Type Statistic</i>
---------	---

---

### Description

This function computes the Rényi-type statistic.

### Usage

```
stat_Zn(dat, kn = function(n) { floor(sqrt(n)) }, estimate = FALSE,
  use_kernel_var = FALSE, custom_var = NULL, kernel = "ba",
  bandwidth = "and", get_all_vals = FALSE)
```

### Arguments

<code>dat</code>	The data vector
<code>kn</code>	A function corresponding to the trimming parameter $t_T$ ; by default, the square root function
<code>estimate</code>	Set to <code>TRUE</code> to return the estimated location of the change point
<code>use_kernel_var</code>	Set to <code>TRUE</code> to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if <code>FALSE</code> , then the long-run variance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left( \sum_{s=1}^t (X_s - \bar{X}_t)^2 + \sum_{s=t+1}^T (X_s - \tilde{X}_{T-t})^2 \right)$ , where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$ ; if <code>custom_var</code> is not <code>NULL</code> , this argument is ignored

custom_var	Can be a vector the same length as dat consisting of variance-like numbers at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occurred) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential change point; if NULL, this argument is ignored
kernel	If character, the identifier of the kernel function as used in <b>cointReg</b> (see <a href="#">getLongRunVar</a> ); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in <b>cointReg</b> )
bandwidth	If character, the identifier for how to compute the bandwidth as defined in <b>cointReg</b> (see <a href="#">getBandwidth</a> ); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in <b>cointReg</b> )
get_all_vals	If TRUE, return all values for the statistic at every tested point in the data set

Details

The definition of the statistic is

$$\max_{t_T \leq t \leq T-t_T} \hat{\sigma}_{t,T}^{-1} \left| t^{-1} \sum_{s=1}^t X_s - (T-t)^{-1} \sum_{s=t+1}^T X_s \right|$$

The parameter kn corresponds to the trimming parameter  $t_T$ .

Value

If both estimate and get\_all\_vals are FALSE, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are TRUE, the test statistic is in the first position and the estimated change point in the second)

Examples

```
CPAT:::stat_Zn(rnorm(1000))
CPAT:::stat_Zn(rnorm(1000), kn = function(n) {floor(log(n))})
CPAT:::stat_Zn(rnorm(1000), use_kernel_var = TRUE, bandwidth = "nw",
               kernel = "bo")
```

---

%s%	<i>Concatenate (With Space)</i>
-----	---------------------------------

---

Description

Concatenate and form strings (with space separation)

Usage

```
x %s% y
```

Arguments

x	One object
y	Another object

**Value**

A string combining x and y with a space separating them

**Examples**

```
`%s%` <- CPAT:::`%s%`  
"Hello" %s% "world"
```

---

%s0%	<i>Concatenate (Without Space)</i>
------	------------------------------------

---

**Description**

Concatenate and form strings (no space separation)

**Usage**

```
x %s0% y
```

**Arguments**

- x                    One object
- y                    Another object

**Value**

A string combining x and y

**Examples**

```
`%s0%` <- CPAT:::`%s0%`  
"Hello" %s0% "world"
```
