Package 'CPAT'

October 28, 2018
Title Change Point Analysis Tests
Version 0.1.0
Date 2018-10-16
Maintainer Curtis Miller <cmiller@math.utah.edu></cmiller@math.utah.edu>
Description Implements several statistical tests for structural change, specifically the tests featured in Horváth, Rice and Miller (in press).
Depends R (>= 3.2)
Suggests cointReg (>= 0.2), foreach (>= 1.4), doRNG (>= 1.7), doParallel (>= 1.0), ggplot2 (>= 2.2), dplyr (>= 0.7), tikzDevice (>= 0.12), testthat (>= 2.0)

Package Attach Hook Function

Description

Hook triggered when package attached

Usage

Index

```
.onAttach(lib, pkg)
```

Arguments

1ib a character string giving the library directory where the package defining the

namespace was found

pkg a character string giving the name of the package

```
CPAT:::onAttach(.libPaths()[1], "CPAT")
```

Andrews.test 3

Andrews.test

Andrews' Test for End-of-Sample Structural Change

Description

Performs Andrews' test for end-of-sample structural change, as described in (Andrews 2003). This function works for both univariate and multivariate data depending on the nature of x and whether formula is specified. This function is thus an interface to andrews_test and andrews_test_reg; see the documentation of those functions for more details.

Usage

```
Andrews.test(x, M, formula = NULL)
```

Arguments

Data to test for change in mean (either a vector or data.frame)
 Numeric index of the location of the first potential change point
 The regression formula, which will be passed to lm

Value

A htest-class object containing the results of the test

References

Andrews DWK (2003). "End-of-Sample Instability Tests." *Econometrica*, **71**(6), 1661–1694. ISSN 00129682, 14680262, https://www.jstor.org/stable/1555535.

Examples

```
Andrews.test(rnorm(1000), M = 900)

x \leftarrow rnorm(1000)

y \leftarrow 1 + 2 * x + rnorm(1000)

df \leftarrow data.frame(x, y)

Andrews.test(df, y \sim x, M = 900)
```

andrews_test

Univariate Andrews Test for End-of-Sample Structural Change

Description

This implements Andrews' test for end-of-sample change, as described by Andrews (2003). This test was derived for detecting a change in univariate data. See (Andrews 2003) for a description of the test.

Usage

```
andrews_test(x, M, pval = TRUE, stat = TRUE)
```

4 andrews_test_reg

Arguments

x Vector of the data to test

M Numeric index of the location of the first potential change point

pval If TRUE, return a p-value stat If TRUE, return a test statistic

Value

If both pval and stat are TRUE, a list containing both; otherwise, a number for one or the other, depending on which is TRUE

References

Andrews DWK (2003). "End-of-Sample Instability Tests." *Econometrica*, **71**(6), 1661–1694. ISSN 00129682, 14680262, https://www.jstor.org/stable/1555535.

Examples

```
CPAT::::andrews\_test(rnorm(1000), M = 900)
```

andrews_test_reg

Multivariate Andrews' Test for End-of-Sample Structural Change

Description

This implements Andrews' test for end-of-sample change, as described by Andrews (2003). This test was derived for detecting a change in multivarate data, aso originally described. See (Andrews 2003) for a description of the test.

Usage

```
andrews_test_reg(formula, data, M, pval = TRUE, stat = TRUE)
```

Arguments

formula The regression formula, which will be passed to 1m

data data. frame containing the data

M Numeric index of the location of the first potential change point

pval If TRUE, return a p-value stat If TRUE, return a test statistic

Value

If both pval and stat are TRUE, a list containing both; otherwise, a number for one or the other, depending on which is TRUE

References

Andrews DWK (2003). "End-of-Sample Instability Tests." *Econometrica*, **71**(6), 1661–1694. ISSN 00129682, 14680262, https://www.jstor.org/stable/1555535.

banks 5

Examples

```
x \leftarrow rnorm(1000)

y \leftarrow 1 + 2 * x + rnorm(1000)

df \leftarrow data.frame(x, y)

CPAT:::andrews\_test\_reg(y \sim x, data = df, M = 900)
```

banks

Bank Portfolio Returns

Description

Data set representing the returns of an industry portfolio representing the banking industry based on company four-digit SIC codes, obtained from the data library maintained by Kenneth French. Data ranges from July 1, 1926 to October 31, 2017.

Usage

banks

Format

A data frame with 24099 rows and 1 variable:

Banks The return of a portfolio representing the banking industry

Row names are dates in YYYY-MM-DD format.

Source

```
http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data_library.html
```

Description

Makes package startup message.

Usage

```
CPAT_startup_message()
```

```
CPAT:::CPAT_startup_message()
```

6 CUSUM.test

cpt_consistent_var

Variance Estimation Consistent Under Change

Description

Estimate the variance (using the sum of squared errors) with an estimator that is consistent when the mean changes at a known point.

Usage

```
cpt_consistent_var(x, k)
```

Arguments

x A numeric vector for the data set

k The potential change point at which the data set is split

Details

This is the estimator

$$\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$$

where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$. In this implementation, T is computed automatically as length(x) and k corresponds to t, a potential change point.

Value

The estimated change-consistent variance

Examples

```
\label{eq:cpat:::cpt_consistent_var} $$ CPAT::::cpt_consistent_var(c(rnorm(500, mean = 0), rnorm(500, mean = 1)), k = 500) $$ $$ (a) $$ (b) $$ (b) $$ (c) $$ (c)
```

 ${\it CUSUM.test}$

CUSUM Test

Description

Performs the (univariate) CUSUM test for change in mean, as described in (Rice et al.). This is effectively an interface to stat_Vn; see its documentation for more details. p-values are computed using pkolmogorov, which represents the limiting distribution of the statistic under the null hypothesis.

Usage

```
CUSUM.test(x, use_kernel_var = FALSE, stat_plot = FALSE,
   kernel = "ba", bandwidth = "and")
```

DE.test 7

Arguments

x Data to test for change in mean

use_kernel_var Set to TRUE to use kernel methods for long-run variance estimation (typically

used when the data is believed to be correlated); if FALSE, then the long-run vari-

ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$,

where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$

stat_plot Whether to create a plot of the values of the statistic at all potential change points

kernel If character, the identifier of the kernel function as used in **cointReg** (see getLongRunVar);

if function, the kernel function to be used for long-run variance estimation (de-

fault is the Bartlett kernel in cointReg)

bandwidth If character, the identifier for how to compute the bandwidth as defined in coin-

tReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews'

method, as used in cointReg)

Value

A htest-class object containing the results of the test

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

DE.test

Darling-Erdös Test

Description

Performs the (univariate) Darling-Erdös test for change in mean, as described in (Rice et al.). This is effectively an interface to stat_de; see its documentation for more details. p-values are computed using pdarling_erdos, which represents the limiting distribution of the test statistic under the null hypothesis when a and b are chosen appropriately. (Change those parameters at your own risk!)

Usage

```
DE.test(x, a = log, b = log, use_kernel_var = FALSE,
    stat_plot = FALSE, kernel = "ba", bandwidth = "and")
```

dZn

Arguments

X	Data to test for change in mean
а	The function that will be composed with $l(x) = (2 \log x)^{1/2}$
b	The function that will be composed with $u(x) = 2\log x + \frac{1}{2}\log\log x - \frac{1}{2}\log\pi$
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run vari-
	ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$,
	where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$
stat_plot	Whether to create a plot of the values of the statistic at all potential change points
kernel	If character, the identifier of the kernel function as used in $cointReg$ (see getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in $cointReg$)
bandwidth	If character, the identifier for how to compute the bandwidth as defined in cointReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in cointReg)

Value

A htest-class object containing the results of the test

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

```
DE.test(rnorm(1000))
DE.test(rnorm(1000), use_kernel_var = TRUE, kernel = "bo", bandwidth = "nw")
```

dZn

Rényi-Type Statistic Limiting Distribution Density Function

Description

Function for computing the value of the density function of the limiting distribution of the Rényitype statistic.

Usage

```
dZn(x, summands = NULL)
```

Arguments

x Point at which to evaluate the density function (note that this parameter is not vectorized)

Number of summands to use in summation (the default should be machine ac-

curate)

ff 9

Value

Value of the density function at x

Examples

CPAT:::dZn(1)

ff

Fama-French Five Factors

Description

Data set containing the five factors described by Fama and French (2015), from the data library maintained by Kenneth French. Data ranges from July 1, 1963 to October 31, 2017.

Usage

ff

Format

A data frame with 13679 rows and 6 variables:

Mkt.RF Market excess returns

RF The risk-free rate of return

SMB The return on a diversified portfolio of small stocks minus return on a diversified portfolio of big stocks

HML The return of a portfolio of stocks with a high book-to-market (B/M) ratio minus the return of a portfolio of stocks with a low B/M ratio

RMW The return of a portfolio of stocks with robust profitability minus a portfolio of stocks with weak profitability

CMA The return of a portfolio of stocks with conservative investment minus the return of a portfolio of stocks with aggressive investment

Row names are dates in YYYYMMDD format.

Source

http://mba.tuck.dartmouth.edu/pages/faculty/ken.french/data_library.html

10 get_lrv_vec

getLongRunWeights	Weights for Long-Run Variance	

Description

Compute some weights for long-run variance. This code comes directly from the source code of **cointReg**; see getLongRunWeights.

Usage

```
getLongRunWeights(n, bandwidth, kernel = "ba")
```

Arguments

n Length of weights' vector bandwidth A number for the bandwidth

kernel The kernel function; see getLongRunVar for possible values

Value

List with components w containing the vector of weights and upper, the index of the largest non-zero entry in w

Examples

```
CPAT:::getLongRunWeights(10, 1)
```

get_lrv_vec

Long-Run Variance Estimation With Possible Change Points

Description

Computes the estimates of the long-run variance in a change point context, as described in (Rice et al.). By default it uses kernel and bandwidth selection as used in the package **cointReg**, though changing the parameters kernel and bandwidth can change this behavior. If **cointReg** is not installed, the Bartlett internal (defined internally) will be used and the bandwidth will be the square root of the sample size.

Usage

```
get_lrv_vec(dat, kernel = "ba", bandwidth = "and")
```

Arguments

dat The data vector

kernel If character, the identifier of the kernel function as used in **cointReg** (see getLongRunVar);

if function, the kernel function to be used for long-run variance estimation (de-

fault is the Bartlett kernel in cointReg)

bandwidth If character, the identifier for how to compute the bandwidth as defined in coin-

tReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews'

method, as used in cointReg)

HR.test 11

Value

A vector of estimates of the long-run variance

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

```
x <- rnorm(1000)
CPAT:::get_lrv_vec(x)
CPAT:::get_lrv_vec(x, kernel = "pa", bandwidth = "nw")
```

HR.test

Rényi-Type Test

Description

Performs the (univariate) Rényi-type test for change in mean, as described in (Rice et al.). This is effectively an interface to stat_Zn; see its documentation for more details. p-values are computed using pZn, which represents the limiting distribution of the test statistic under the null hypothesis, which represents the limiting distribution of the test statistic under the null hypothesis when kn represents a sequence t_T satisfying $t_T \to \infty$ and $t_T/T \to 0$ as $T \to \infty$. (log and sqrt should be good choices.)

Usage

```
HR.test(x, kn = log, use_kernel_var = FALSE, stat_plot = FALSE,
  kernel = "ba", bandwidth = "and")
```

Arguments

Data to test for change in mean Х

kn A function corresponding to the trimming parameter t_T ; by default, the square

root function

Set to TRUE to use kernel methods for long-run variance estimation (typically use_kernel_var

used when the data is believed to be correlated); if FALSE, then the long-run vari-

ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$, where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$; if custom_var is not NULL, this argument is ignored

is not NULL, this argument is ignored

stat_plot Whether to create a plot of the values of the statistic at all potential change points

If character, the identifier of the kernel function as used in **cointReg** (see getLongRunVar); kernel

if function, the kernel function to be used for long-run variance estimation (de-

fault is the Bartlett kernel in **cointReg**)

bandwidth If character, the identifier for how to compute the bandwidth as defined in coin-

> tReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews'

method, as used in **cointReg**)

HS.test

Value

A htest-class object containing the results of the test

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

```
HR.test(rnorm(1000))
HR.test(rnorm(1000), use_kernel_var = TRUE, kernel = "bo", bandwidth = "nw")
```

HS.test

Hidalgo-Seo Test

Description

Performs the (univariate) Hidalgo-Seo test for change in mean, as described in (Rice et al.). This is effectively an interface to stat_hs; see its documentation for more details. p-values are computed using phidalgo_seo, which represents the limiting distribution of the test statistic when the null hypothesis is true.

Usage

```
HS.test(x, corr = TRUE, stat_plot = FALSE)
```

Arguments

X	Data to test for change in mean
corr	If TRUE, the long-run variance will be computed under the assumption of correlated residuals; ignored if custom_var is not NULL or use_kernel_var is TRUE
stat_plot	Whether to create a plot of the values of the statistic at all potential change points

Value

A htest-class object containing the results of the test

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

```
HS.test(rnorm(1000))
HS.test(rnorm(1000), corr = FALSE)
```

pdarling_erdos 13

pdarling_erdos

Darling-Erdös Statistic CDF

Description

CDF for the limiting distribution of the Darling-Erdös statistic.

Usage

```
pdarling_erdos(q)
```

Arguments

q

Quantile input to CDF

Value

If Z is the random variable with this distribution, the quantity $P(Z \le q)$

Examples

```
CPAT:::pdarling_erdos(0.1)
```

phidalgo_seo

Hidalgo-Seo Statistic CDF

Description

CDF of the limiting distribution of the Hidalgo-Seo statistic

Usage

```
phidalgo_seo(q)
```

Arguments

q

Quantile input to CDF

Value

If Z is the random variable following the limiting distribution, the quantity $P(Z \le q)$

```
CPAT:::phidalgo_seo(0.1)
```

pZn

pkolmogorov

Kolmogorov CDF

Description

CDF of the Kolmogorov distribution.

Usage

```
pkolmogorov(q, summands = ceiling(q * sqrt(72) + 3/2))
```

Arguments

q Quantile input to CDF

summands Number of summands for infinite sum (the default should have machine accu-

racy)

Value

If Z is the random variable following the Kolmogorov distribution, the quantity $P(Z \leq q)$

Examples

```
CPAT:::pkolmogorov(0.1)
```

pZn

Rènyi-Type Statistic CDF

Description

CDF for the limiting distribution of the Rènyi-type statistic.

Usage

```
pZn(q, summands = NULL)
```

Arguments

q Quantile input to CDF

summands Number of summands for infinite sum; if NULL, automatically determined

Value

If Z is the random variable following the limiting distribution, the quantity $P(Z \le q)$

```
CPAT:::pZn(0.1)
```

qdarling_erdos 15

qdarling_erdos

Darling-Erdös Statistic Limiting Distribution Quantile Function

Description

Quantile function for the limiting distribution of the Darling-Erdös statistic.

Usage

```
qdarling_erdos(p)
```

Arguments

р

The probability associated with the desired quantile

Value

The quantile associated with p

Examples

```
CPAT:::qdarling_erdos(0.5)
```

qhidalgo_seo

Hidalgo-Seo Statistic Limiting Distribution Quantile Function

Description

Quantile function for the limiting distribution of the Hidalgo-Seo statistic

Usage

```
qhidalgo_seo(p)
```

Arguments

р

The probability associated with the desired quantile

Value

A The quantile associated with p

```
CPAT:::qhidalgo_seo(0.5)
```

qZn

qkolmogorov

Kolmogorov Distribution Quantile Function

Description

Quantile function for the Kolmogorov distribution.

Usage

```
qkolmogorov(p, summands = 500, interval = c(0, 100), tol = .Machine$double.eps, ...)
```

Arguments

```
p Value of the CDF at the quantile summands
interval, tol, ...
Arguments to be passed to uniroot
```

Details

This function uses uniroot for finding this quantity, and many of the accepted parameters are arguments for that function; see its documentation for more details.

Value

The quantile associated with p

Examples

```
CPAT:::qkolmogorov(0.5)
```

qZn

Rènyi-Type Statistic Quantile Function

Description

Quantile function for the limiting distribution of the Rènyi-type statistic.

Usage

```
qZn(p, summands = 500, interval = c(0, 100),
tol = .Machine$double.eps, ...)
```

```
p Value of the CDF at the quantile summands Number of summands for infinite sum interval, tol, ... Arguments to be passed to uniroot
```

rchangepoint 17

Details

This function uses uniroot for finding this quantity, and many of the the accepted parameters are arguments for that function; see its documentation for more details.

Value

The quantile associated with p

Examples

```
CPAT:::qZn(0.5)
```

rchangepoint

Simulate Univariate Data With a Single Change Point

Description

This function simulates univariate data with a structural change.

Usage

```
rchangepoint(n, changepoint = NULL, mean1 = 0, mean2 = 0,
  dist = rnorm, meanparam = "mean", ...)
```

Arguments

n An integer for the data set's sample size
changepoint An integer for where the change point occurs
mean1 The mean prior to the change point
mean2 The mean after the change point
dist The function with which random data will be generated
meanparam A string for the parameter in dist representing the mean
... Other arguments to be passed to dist

Details

This function generates artificial change point data, where up to the specified change point the data has one mean, and after the point it has a different mean. By default, the function simulates standard Normal data with no change. If changepoint is NULL, then by default the change point will be at about the middle of the data.

Value

A vector of the simulated data

18 sim_de_stat

sim_de_stat	Darling-Erdös Statistic Simulation	
-------------	------------------------------------	--

Description

Simulates multiple realizations of the Darling-Erdös statistic.

Usage

```
sim_de_stat(size, a = log, b = log, use_kernel_var = FALSE,
  kernel = "ba", bandwidth = "and", n = 500, gen_func = rnorm,
  args = NULL, parallel = FALSE)
```

Arguments

size	Number of realizations to simulate
а	The function that will be composed wit $l(x) = (2 \log(x))^{1/2}$
b	The function that will be composed with $u(x) = 2\log(x) + \frac{1}{2}\log(\log(x)) - \frac{1}{2}\log(pi)$
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed)
kernel	If character, the identifier of the kernel function as used in the cointReg (see documentation for cointReg::getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in cointReg); this parameter has no effect if use_kernel_var is FALSE
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the cointReg package (see documentation for cointReg::getLongRunVar); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the Andrews (1991) method, as used in cointReg); this parameter has no effect if use_kernel_var is FALSE
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to gen_func
parallel	Whether to use the foreach and doParallel packages to parallelize simulation (which needs to be initialized in the global namespace before use)

Details

If use_kernel_var is set to TRUE, long-run variance estimation using kernel-based techniques will be employed; otherwise, a technique resembling standard variance estimation will be employed. Any technique employed, though, will account for the potential break points, as described in Rice et al. (). See the documentation for stat_de for more details.

The parameters kernel and bandwidth control parameters for long-run variance estimation using kernel methods. These parameters will be passed directly to stat_de.

Value

A vector of simulated realizations of the Darling-Erdös statistic

sim_hs_stat

References

Andrews DWK (1991). "Heteroskedasticity and Autocorrelation Consistent Covariance Matrix Estimation." *Econometrica*, **59**(3), 817-858.

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

 sim_hs_stat

Hidalgo-Seo Statistic Simulation

Description

Simulates multiple realizations of the Hidalgo-Seo statistic.

Usage

```
sim_hs_stat(size, corr = TRUE, gen_func = rnorm, args = NULL,
  n = 500, parallel = FALSE, use_kernel_var = FALSE, kernel = "ba",
  bandwidth = "and")
```

Arguments

١	2	
	size	Number of realizations to simulate
	corr	Whether long-run variance should be computed under the assumption of correlated residuals
	gen_func	The function generating the random sample from which the statistic is computed
	args	A list of arguments to be passed to gen_func
	n	The sample size for each realization
	parallel	Whether to use the foreach and doParallel packages to parallelize simulation (which needs to be initialized in the global namespace before use)
	use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed); <i>TODO: NOT CURRENTLY IMPLEMENTED</i>
	kernel	If character, the identifier of the kernel function as used in the cointReg (see documentation for cointReg::getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in cointReg); this parameter has no effect if use_kernel_var is FALSE; <i>TODO:</i> NOT CURRENTLY IMPLEMENTED
	bandwidth	If character, the identifier of how to compute the bandwidth as defined in the cointReg package (see documentation for cointReg::getLongRunVar); if function, a function to use for computing the bandwidth; if numeric, the bandwidth

NOT CURRENTLY IMPLEMENTED

to use (the default behavior is to use the Andrews (1991) method, as used in **cointReg**); this parameter has no effect if use_kernel_var is FALSE; *TODO*:

20 sim_Vn

Details

If corr is TRUE, then the residuals of the data-generating process are assumed to be correlated and the test accounts for this in long-run variance estimation; see the documentation for stat_hs for more details. Otherwise, the sample variance is the estimate for the long-run variance, as described in Hidalgo and Seo (2013).

Value

A vector of simulated realizations of the Hidalgo-Seo statistic

References

Andrews DWK (1991). "Heteroskedasticity and Autocorrelation Consistent Covariance Matrix Estimation." *Econometrica*, **59**(3), 817-858.

Hidalgo J, Seo MH (2013). "Testing for structural stability in the whole sample." *Journal of Econometrics*, **175**(2), 84 - 93. ISSN 0304-4076, doi: 10.1016/j.jeconom.2013.02.008, http://www.sciencedirect.com/science/article/pii/S0304407613000626.

Examples

sim_Vn

CUSUM Statistic Simulation (Assuming Variance)

Description

Simulates multiple realizations of the CUSUM statistic when the long-run variance of the data is known.

Usage

```
sim_Vn(size, n = 500, gen_func = rnorm, sd = 1, args = NULL)
```

Arguments

size	Number of realizations to simulate
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
sd	The square root of the second moment of the data
args	A list of arguments to be passed to gen_func

Value

A vector of simulated realizations of the CUSUM statistic

sim_Vn_stat 21

Examples

sim_Vn_stat

CUSUM Statistic Simulation

Description

Simulates multiple realizations of the CUSUM statistic.

Usage

```
sim_Vn_stat(size, kn = function(n) { 1 }, tau = 0,
use_kernel_var = FALSE, kernel = "ba", bandwidth = "and",
n = 500, gen_func = rnorm, args = NULL, parallel = FALSE)
```

Arguments

size	Number of realizations to simulate
kn	A function returning a positive integer that is used in the definition of the trimmed CUSUSM statistic effectively setting the bounds over which the maximum is taken
tau	The weighting parameter for the weighted CUSUM statistic (defaults to zero for no weighting)
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed)
kernel	If character, the identifier of the kernel function as used in the cointReg (see documentation for cointReg::getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in cointReg); this parameter has no effect if use_kernel_var is FALSE
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the cointReg package (see documentation for cointReg::getLongRunVar); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the method described in (Andrews 1991), as used in cointReg); this parameter has no effect if use_kernel_var is FALSE
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to gen_func
parallel	Whether to use the foreach and doParallel packages to parallelize simulation

(which needs to be initialized in the global namespace before use)

22 sim_Zn

Details

This differs from sim_Vn() in that the long-run variance is estimated with this function, while sim_Vn() assumes the long-run variance is known. Estimation can be done in a variety of ways. If use_kernel_var is set to TRUE, long-run variance estimation using kernel-based techniques will be employed; otherwise, a technique resembling standard variance estimation will be employed. Any technique employed, though, will account for the potential break points, as described in Rice et al. (). See the documentation for stat_Vn for more details.

The parameters kernel and bandwidth control parameters for long-run variance estimation using kernel methods. These parameters will be passed directly to stat_Vn.

Versions of the CUSUM statistic, such as the weighted or trimmed statistics, can be simulated with the function by passing values to kn and tau; again, see the documentation for stat_Vn.

Value

A vector of simulated realizations of the CUSUM statistic

References

Andrews DWK (1991). "Heteroskedasticity and Autocorrelation Consistent Covariance Matrix Estimation." *Econometrica*, **59**(3), 817-858.

Examples

sim_Zn

Rènyi-Type Statistic Simulation (Assuming Variance)

Description

Simulates multiple realizations of the Rènyi-type statistic when the long-run variance of the data is known.

Usage

```
sim_Zn(size, kn, n = 500, gen_func = rnorm, args = NULL, sd = 1)
```

size	Number of realizations to simulate
kn	A function returning a positive integer that is used in the definition of the Rènyi- type statistic effectively setting the bounds over which the maximum is taken
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to gen_func
sd	The square root of the second moment of the data

sim_Zn_stat 23

Value

A vector of simulated realizations of the Rènyi-type statistic

Examples

sim_Zn_stat

Rènyi-Type Statistic Simulation

Description

Simulates multiple realizations of the Rènyi-type statistic.

Usage

```
sim_Zn_stat(size, kn = function(n) { floor(sqrt(n)) },
  use_kernel_var = FALSE, kernel = "ba", bandwidth = "and",
  n = 500, gen_func = rnorm, args = NULL, parallel = FALSE)
```

size	Number of realizations to simulate
kn	A function returning a positive integer that is used in the definition of the Rènyi- type statistic effectively setting the bounds over which the maximum is taken
use_kernel_var	Set to TRUE to use kernel-based long-run variance estimation (FALSE means this is not employed) $$
kernel	If character, the identifier of the kernel function as used in the cointReg (see documentation for cointReg::getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in cointReg); this parameter has no effect if use_kernel_var is FALSE
bandwidth	If character, the identifier of how to compute the bandwidth as defined in the cointReg package (see documentation for cointReg::getLongRunVar); if function, a function to use for computing the bandwidth; if numeric, the bandwidth to use (the default behavior is to use the Andrews (1991) method, as used in cointReg); this parameter has no effect if use_kernel_var is FALSE
n	The sample size for each realization
gen_func	The function generating the random sample from which the statistic is computed
args	A list of arguments to be passed to gen_func
parallel	Whether to use the foreach and doParallel packages to parallelize simulation (which needs to be initialized in the global namespace before use)

24 stat_de

Details

This differs from sim_Zn() in that the long-run variance is estimated with this function, while sim_Zn() assumes the long-run variance is known. Estimation can be done in a variety of ways. If use_kernel_var is set to TRUE, long-run variance estimation using kernel-based techniques will be employed; otherwise, a technique resembling standard variance estimation will be employed. Any technique employed, though, will account for the potential break points, as described in Rice et al. (). See the documentation for stat_Zn for more details.

The parameters kernel and bandwidth control parameters for long-run variance estimation using kernel methods. These parameters will be passed directly to stat_Zn.

Value

A vector of simulated realizations of the Rènyi-type statistic

References

Andrews DWK (1991). "Heteroskedasticity and Autocorrelation Consistent Covariance Matrix Estimation." *Econometrica*, **59**(3), 817-858.

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

stat_de

Compute the Darling-Erdös Statistic

Description

This function computes the Darling-Erdös statistic.

Usage

```
stat_de(dat, a = log, b = log, estimate = FALSE,
  use_kernel_var = FALSE, custom_var = NULL, kernel = "ba",
  bandwidth = "and", get_all_vals = FALSE)
```

dat	The data vector
а	The function that will be composed with $l(x) = (2 \log x)^{1/2}$
b	The function that will be composed with $u(x) = 2\log x + \frac{1}{2}\log\log x - \frac{1}{2}\log\pi$
estimate	Set to TRUE to return the estimated location of the change point
use_kernel_var	Set to TRUE to use kernel methods for long-run variance estimation (typically used when the data is believed to be correlated); if FALSE, then the long-run vari-
	ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$,
	where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$

stat_hs 25

custom_var	Can be a vector the same length as dat consisting of variance-like numbers at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occured) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential change point; if NULL, this argument is ignored
kernel	If character, the identifier of the kernel function as used in cointReg (see getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in cointReg)
bandwidth	If character, the identifier for how to compute the bandwidth as defined in cointReg (see <pre>getBandwidth</pre>); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews' method, as used in cointReg)
get_all_vals	If TRUE, return all values for the statistic at every tested point in the data set

Details

If $\bar{A}_T(\tau, t_T)$ is the weighted and trimmed CUSUM statistic with weighting parameter τ and trimming parameter t_T (see stat_Vn), then the Darling-Erdös statistic is

$$l(a_T)\bar{A}_T(1/2,1) - u(b_T)$$

with $l(x) = \sqrt{2 \log x}$ and $u(x) = 2 \log x + \frac{1}{2} \log \log x - \frac{1}{2} \log \pi$ (log x is the natural logarithm of x). The parameter a corresponds to a_T and b to b_T ; these are both log by default.

See (Rice et al.) to learn more.

Value

If both estimate and get_all_vals are FALSE, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are TRUE, the test statistic is in the first position and the estimated change point in the second)

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

```
CPAT:::stat_de(rnorm(1000))
CPAT:::stat_de(rnorm(1000), use_kernel_var = TRUE, bandwidth = "nw", kernel = "bo")
```

stat_hs

Compute the Hidalgo-Seo Statistic

Description

This function computes the Hidalgo-Seo statistic for a change in mean model.

26 stat_hs

Usage

```
stat_hs(dat, estimate = FALSE, corr = TRUE, get_all_vals = FALSE,
 custom_var = NULL, use_kernel_var = FALSE, kernel = "ba",
 bandwidth = "and")
```

Arguments

dat The data vector

Set to TRUE to return the estimated location of the change point estimate

If TRUE, the long-run variance will be computed under the assumption of correcorr

lated residuals; ignored if custom_var is not NULL or use_kernel_var is TRUE

get_all_vals If TRUE, return all values for the statistic at every tested point in the data set

Can be a vector the same length as dat consisting of variance-like numbers custom_var

> at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occured) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential

change point; if NULL, this argument is ignored

use_kernel_var Set to TRUE to use kernel methods for long-run variance estimation (typically

used when the data is believed to be correlated); if FALSE, then the long-run vari-

ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$, where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$; if custom_var

is not NULL, this argument is ignored

If character, the identifier of the kernel function as used in **cointReg** (see getLongRunVar); kernel

if function, the kernel function to be used for long-run variance estimation (de-

fault is the Bartlett kernel in **cointReg**)

bandwidth If character, the identifier for how to compute the bandwidth as defined in coin-

tReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews'

method, as used in **cointReg**)

Details

For a data set x_t with n observations, the test statistic is

$$\max_{1 \le s \le n-1} (\mathcal{LM}(s) - B_n) / A_n$$

where $\hat{u}_t = x_t - \bar{x}$ (\bar{x} is the sample mean), $a_n = (2 \log \log n)^{1/2}$, $b_n = a_n^2 - \frac{1}{2} \log \log \log n$ $\log \Gamma(1/2), \ A_n = b_n/a_n^2, \ B_n = b_n^2/a_n^2, \ \hat{\Delta} = \hat{\sigma}^2 = n^{-1} \sum_{t=1}^n \hat{u}_t^2, \text{ and } \mathcal{LM}(s) = n(n-s)^{-1} s^{-1} \hat{\Delta}^{-1} \left(\sum_{t=1}^s \hat{u}_t\right)^2.$

If corr is FALSE, then the residuals are assumed to be uncorrelated. Otherwise, the residuals are assumed to be correlated and $\hat{\Delta} = \hat{\gamma}(0) + 2\sum_{j=1}^{\lfloor \sqrt{n} \rfloor} (1 - \frac{j}{\sqrt{n}}) \hat{\gamma}(j)$ with $\hat{\gamma}(j) = \frac{1}{n}\sum_{t=1}^{n-j} \hat{u}_t \hat{u}_{t+j}$.

This statistic was presented in (Hidalgo and Seo 2013).

Value

If both estimate and get_all_vals are FALSE, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are TRUE, the test statistic is in the first position and the estimated change point in the second)

 $stat_{Vn}$ 27

Examples

```
CPAT:::stat_hs(rnorm(1000))
CPAT:::stat_hs(rnorm(1000), corr = FALSE)
```

stat_Vn

Compute the CUSUM Statistic

Description

This function computes the CUSUM statistic (and can compute weighted/trimmed variants, depending on the values of kn and tau).

Usage

```
stat_Vn(dat, kn = function(n) {     1 }, tau = 0, estimate = FALSE,
    use_kernel_var = FALSE, custom_var = NULL, kernel = "ba",
    bandwidth = "and", get_all_vals = FALSE)
```

method, as used in cointReg)

Arguments

get_all_vals

dat	The data vector
kn	A function corresponding to the trimming parameter t_T in the trimmed CUSUM variant; by default, is a function returning 1 (for no trimming)
tau	The weighting parameter τ for the weighted CUSUM statistic; by default, is 0 (for no weighting)
estimate	Set to TRUE to return the estimated location of the change point
use_kernel_var	used when the data is believed to be correlated); if FALSE, then the long-run vari-
	ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$,
	where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$
custom_var	Can be a vector the same length as dat consisting of variance-like numbers at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occured) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential change point; if NULL, this argument is ignored
kernel	If character, the identifier of the kernel function as used in cointReg (see getLongRunVar); if function, the kernel function to be used for long-run variance estimation (default is the Bartlett kernel in cointReg)
bandwidth	If character, the identifier for how to compute the bandwidth as defined in cointReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews'

If TRUE, return all values for the statistic at every tested point in the data set

28 stat_Zn

Details

The definition of the statistic is

$$T^{-1/2} \max_{1 \le t \le T} \hat{\sigma}_{t,T}^{-1} \left| \sum_{s=1}^{t} X_s - \frac{t}{T} \sum_{s=1}^{T} \right|$$

A more general version is

$$T^{-1/2} \max_{t_T \le t \le T - t_T} \hat{\sigma}_{t,T}^{-1} \left(\frac{t}{T} \left(\frac{T - t}{T} \right) \right)^{\tau} \left| \sum_{s=1}^{t} X_s - \frac{t}{T} \sum_{s=1}^{T} \right|$$

The parameter kn corresponds to the trimming parameter t_T and the parameter tau corresponds to τ .

See (Rice et al.) for more details.

Value

If both estimate and get_all_vals are FALSE, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are TRUE, the test statistic is in the first position and the estimated change point in the second)

References

Rice G, Miller C, Horváth L (????). "A new class of change point test of Rényi type." in-press.

Examples

```
CPAT:::stat_Vn(rnorm(1000))
CPAT:::stat_Vn(rnorm(1000), kn = function(n) {0.1 * n}, tau = 1/2)
CPAT:::stat_Vn(rnorm(1000), use_kernel_var = TRUE, bandwidth = "nw", kernel = "bo")
```

stat_Zn

Compute the Rényi-Type Statistic

Description

This function computes the Rényi-type statistic.

Usage

```
stat_Zn(dat, kn = function(n) {      floor(sqrt(n)) }, estimate = FALSE,
      use_kernel_var = FALSE, custom_var = NULL, kernel = "ba",
      bandwidth = "and", get_all_vals = FALSE)
```

stat_Zn 29

Arguments

The data vector dat

A function corresponding to the trimming parameter t_T ; by default, the square kn

root function

estimate Set to TRUE to return the estimated location of the change point

Set to TRUE to use kernel methods for long-run variance estimation (typically use_kernel_var

used when the data is believed to be correlated); if FALSE, then the long-run vari-

ance is estimated using $\hat{\sigma}_{T,t}^2 = T^{-1} \left(\sum_{s=1}^t \left(X_s - \bar{X}_t \right)^2 + \sum_{s=t+1}^T \left(X_s - \tilde{X}_{T-t} \right)^2 \right)$, where $\bar{X}_t = t^{-1} \sum_{s=1}^t X_s$ and $\tilde{X}_{T-t} = (T-t)^{-1} \sum_{s=t+1}^T X_s$; if custom_var is not NULL, this argument is ignored

Can be a vector the same length as dat consisting of variance-like numbers custom_var

> at each potential change point (so each entry of the vector would be the "best estimate" of the long-run variance if that location were where the change point occured) or a function taking two parameters x and k that can be used to generate this vector, with x representing the data vector and k the position of a potential

change point; if NULL, this argument is ignored

kernel If character, the identifier of the kernel function as used in **cointReg** (see getLongRunVar);

if function, the kernel function to be used for long-run variance estimation (de-

fault is the Bartlett kernel in cointReg)

bandwidth If character, the identifier for how to compute the bandwidth as defined in coin-

> tReg (see getBandwidth); if function, a function to use for computing the bandwidth; if numeric, the bandwidth value to use (the default is to use Andrews'

method, as used in **cointReg**)

If TRUE, return all values for the statistic at every tested point in the data set get_all_vals

Details

The definition of the statistic is

$$\max_{t_T \le t \le T - t_T} \hat{\sigma}_{t,T}^{-1} \left| t^{-1} \sum_{s=1}^t X_s - (T - t)^{-1} \sum_{s=t+1}^T X_s \right|$$

The parameter kn corresponds to the trimming parameter t_T .

Value

If both estimate and get_all_vals are FALSE, the value of the test statistic; otherwise, a list that contains the test statistic and the other values requested (if both are TRUE, the test statistic is in the first position and the estimated change point in the second)

```
CPAT:::stat_Zn(rnorm(1000))
CPAT:::stat_Zn(rnorm(1000), kn = function(n) {floor(log(n))})
CPAT:::stat_Zn(rnorm(1000), use_kernel_var = TRUE, bandwidth = "nw",
               kernel = "bo")
```
